A Comprehensive Approach to Save Energy

SELECT ENERGY
solutions inc
@ Your Service

Select Energy Solutions, Inc. provides a wide range of services that uncover the best overall solutions to controlling the high cost of energy. The first service recommended is a comprehensive power audit to determine where your facility consumes energy. Select Energy has the latest software and technology to break an energy bill into 5 separate categories; Lighting, Heating and Cooling, Refrigeration, Motors and Resistive Loads. Second, we recommend a Power Quality Analysis to determine any anomalies that could cause energy inefficiencies throughout your electrical distribution system. Power Quality issues cause maintenance cost to rise and typically shorten motor life expectancy. Electrical Infrared inspections help determine hot spots which can go undetected and cause catastrophic events. Through our metering and monitoring systems, we can capture real time energy consumption from various loads to identify peak load contribution and other valuable information. Our holistic approach incorporates several complimentary services to reduce all utility costs including natural gas and water. Finally, we would like to remove all the confusion and complexity of pricing and purchasing supply by offering consulting services that make your decision painless.
